Research Centre for Gender and Health

## AUSTRALIAN LONGITUDINAL STUDY ON WOMEN'S HEALTH

## Report on the provision of data to the Office for Women

November 2005

Delivered to
Office for Women, Department of Family and Community Services

Deborah Loxton, PhD<br>Jennifer Powers<br>Anne Young, PhD<br>with assistance from<br>Angela Wood

The Australian Longitudinal Study on Women's Health is funded by the Australian Commonwealth Department of Health and Ageing and conducted by a team of researchers at the Universities of Newcastle and Queensland, Australia.

This project was funded by the Office for Women, Department of Family and Community Services.
Thanks are due to Jean Ball, Catherine Chojenta, Andrew Hampson and Dr.Virginia Wheway for their assistance with this report. Thank you to all of the staff at the Research Centre for Gender and Health, the

University of Newcastle, who contributed to the completion of this research.
We also wish to thank the women who participate in the ALWSH.

## SECTION 1: INTRODUCTION <br> \& DOCUMENTATION

## The Australian Longitudinal Study on Women's Health

The Australian Longitudinal Study on Women's Health (ALSWH) - widely known as Women's Health Australia - is a longitudinal population-based mailed survey, funded by the Australian Government Department of Health and Ageing. The project began in 1996 and examines the health of over 40,000 Australian women.

The ALSWH involves three large, nationally representative, cohorts of Australian women representing three generations:

- The Younger cohort women, aged 18-23 when first recruited in 1996 ( $\mathrm{n}=14247$ ), are now in their late 20s, the peak years for relationship formation, childbearing, and establishing adult health habits (eg physical activity, diet) and paid and unpaid work patterns.
- The Mid-age cohort, initially aged 45-50 ( $\mathrm{n}=13716$ ), are now experiencing menopause, as well as changes in household structure, family care giving, and impending retirement, which are common at this life stage. Some are showing early signs of age-related physical decline, while some are adopting new health behaviours in preparation for a healthy old age.
- The Older women, aged 70-75 when first recruited ( $\mathrm{n}=12432$ ), are in their 80 s and facing the physical, emotional and social challenges of old age.

Features of the study design include:

- Women were randomly selected from the Medicare database and invited to participate in the longitudinal study.
- Women in rural and remote areas of Australia were intentionally over-sampled to ensure adequate numbers for statistical analysis.
- After Survey 1 in 1996, the three age cohorts have been surveyed sequentially, one cohort per year, on a rolling basis since 1998 (see Figure 1).

(i) Figure 1.1: Timeline for main ALSWH Surveys

The study was designed to explore factors that influence health among women who are broadly representative of the entire Australian population. The study assesses:

- Physical and emotional health (including well-being, major diagnoses, symptoms)
- Use of health services (GP, specialist and other visits, access, satisfaction)
- Health behaviours and risk factors (diet, exercise, smoking, alcohol, other drugs)
- Time use (including paid and unpaid work, family roles, and leisure)
- Socio-demographic factors (location, education, employment, family composition)
- Life stages and key events (such as childbirth, divorce, widowhood).

The project provides a valuable opportunity to examine associations over time between aspects of women's lives and their physical and emotional health. It provides an evidence base to the Australian Government Department of Health and Ageing - as well as other Australian and State/Territory Departments - for the development and evaluation of policy and practice in many areas of service delivery that affect women. An overview of the study and investigators, copies of the questionnaires, and abstracts of all publications and presentations can be located on the Study's website:

## http://www.newcastle.edu.au/centre/wha

The project has been able to retain a very high proportion of the original participants. Among the Younger cohort women, 68\% responded to Survey 2 in 2000 and $64 \%$ to Survey 3 in 2003, retention rates which compare well with other surveys of this highly mobile age group. Retention rates have been much higher among the Mid-age cohort; $90 \%$ and $83 \%$ of the Mid-age cohort respectively responded to Survey 2 in 1998 and Survey 3 in 2001.

The focus of the data cubes is the Younger and Mid-age cohorts. The notation used in the data cubes, the years the surveys were conducted and the ages of the women are shown in table below.

Notation for the surveys used in this report.

| Year | Younger | Mid-age |
| :--- | :--- | :--- |
| $\mathbf{1 9 9 6}$ | Y1 <br> $18-23$ <br> yrs | M1 <br> $45-50 ~ y r s ~$ |
| $\mathbf{1 9 9 7}$ |  |  |
| $\mathbf{1 9 9 8}$ |  | M2 <br> $47-52 ~ y r s ~$ |
| $\mathbf{1 9 9 9}$ |  |  |
| $\mathbf{2 0 0 0}$ | Y2 <br> $22-27 ~ y r s ~$ |  |
| $\mathbf{2 0 0 1}$ |  | M3 <br> $50-55 ~ y r s ~$ |
| $\mathbf{2 0 0 2}$ |  |  |
| $\mathbf{2 0 0 3}$ | Y3 <br> $25-30 ~ y r s ~$ |  |

Report: Data for OfW

## Limitations of the data

- Because of uncertainties about the accuracy of the Medicare database (which was used as the sampling frame for the stratified random samples), response rates cannot be exactly specified. It is estimated that $41 \%-42 \%$ and $53-56 \%$ of the Younger and Mid-age cohorts, respectively, responded to the initial invitation to participate.
- Aggregate data for nonrespondents’ use of health services (from the Australian Medicare database) suggest that there are small differences in use of health services among respondents and nonrespondents, with nonrespondents less likely, for example, to have visited a medical specialist in the last 2 years (Mid-age: 49\% versus $54 \%$ ). There was not a significant difference in health service use between respondents and nonrespondents from the Younger cohort.
- Comparison with the 1996 census data confirmed that the participants in each of the cohorts are reasonably representative of the general population of women of the same age in Australia. There is some over-representation of women with tertiary education and under-representation of some groups of immigrant women.
- Retention at Surveys 2 and 3 was calculated as percentage of respondents at each survey as a percentage of respondents at Survey 1 once those who had died or were too ill to complete surveys had been excluded.
- Retention varied for the cohorts: $68 \%$ and $64 \%$ of the Younger cohort and $90 \%$ and $83 \%$ of the Mid-age cohort completed Surveys 2 and 3 respectively.
- Respondents of all ages were more likely to have tertiary education, to be Australian born and to be non-smokers than non-respondents at subsequent surveys. Hence biases may exist for women with lower socioeconomic status (less educated), immigrant women and those who are current smokers.
- Mid-age respondents reported better self-rated health at Survey 1 than women who did not respond to subsequent surveys. Findings at Surveys 2 and 3 may be more indicative of those who are in better health in their age groups.
- Most, but not all women complete every survey, and not all women who complete surveys answer every question. This results in missing data, which may lead to results that are more complex to interpret than they first appear. To avoid misinterpretation, data cubes should be viewed as preliminary findings and should be considered as a guide for further research.
- Data are presented as three cross-sectional data points. For example, when examining area of residence and relationship (marital) status and leaking urine amongst the Mid-age cohort it should be remembered that at each survey there will be different women who are classified as living alone and also different women who report leaking urine. Therefore the results should not be interpreted as an improvement or decline in the problem of leaking urine in specific relationship groups over time. Hence trend lines (lines that connect data points) on graphs may be misleading and should not be used.

## Data should not be used to draw conclusions. Data can be used to identify specific hypotheses that require further analyses.

Data from this website can be quoted but the source of the data must be noted as the Australian Longitudinal Study on Women's Health, and limitations of the data must be taken into account.

The Australian Longitudinal Study on Women's Health is funded by the Australian Government Department of Health and Ageing and is conducted by teams of researchers and staff at the University of Newcastle and the University of Queensland.
